2020 Annual Drinking Water Quality Report Town of Mantachie PWS#: 0290005 May 2021

2021 MAY 13 AM & 10

We're pleased to present to you this year's Annual Quality Water Report. This report is designed to inform you about the quality water and services we deliver to you every day. Our constant goal is to provide you with a safe and dependable supply of drinking water. We want you to understand the efforts we make to continually improve the water treatment process and protect our water resources. We are committed to ensuring the quality of your water.

If you have any questions about this report or concerning your water utility, please contact Rodney McFerrin at 662.282.7949. We want our valued customers to be informed about their water utility. If you want to learn more, please attend any of our regularly scheduled meetings. They are held on the second Tuesday of each month at 6:00 PM at the Mantachie Town Hall.

In order to better serve our customers with a better water supply the Town of Mantachie began purchasing our water from the Northeast MS Regional Water Supply, which has greatly improved our water system. The source water assessment has been completed for our public water system to determine the overall susceptibility of its drinking water supply to identify potential sources of contamination. A report containing detailed information on how the susceptibility determinations were made has been furnished to our public water system and is available for viewing upon request. The wells for the Town of Mantachie have received lower to moderate susceptibility rankings to contamination.

We routinely monitor for contaminants in your drinking water according to Federal and State laws. This table below lists all of the drinking water contaminants that were detected during the period of January 1st to December 31st, 2020. In cases where monitoring wasn't required in 2020, the table reflects the most recent results. As water travels over the surface of land or underground, it dissolves naturally occurring minerals and, in some cases, radioactive materials and can pick up substances or contaminants from the presence of animals or from human activity; microbial contaminants, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife; inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban storm-water runoff, industrial, or domestic wastewater discharges, oil and gas production, mining, or farming; pesticides and herbicides, which may come from a variety of sources such as agriculture, urban storm-water runoff, and residential uses; organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations and septic systems; radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities. In order to ensure that tap water is safe to drink, EPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. All drinking water, including bottled drinking water, may be reasonably expected to contain at least small amounts of some contaminants. It's important to remember that the presence of these contaminants does not necessarily indicate that the water poses a health risk.

In this table you will find many terms and abbreviations you might not be familiar with. To help you better understand these terms we've provided the following definitions:

Action Level - the concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

Maximum Contaminant Level (MCL) - The "Maximum Allowed" (MCL) is the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal (MCLG) - The "Goal" (MCLG) is the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Residual Disinfectant Level (MRDL) – The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary to control microbial contaminants.

Parts per million (ppm) or Milligrams per liter (mg/l) - one part per million corresponds to one minute in two years or a single penny in \$10,000.

Parts per billion (ppb) or Micrograms per liter - one part per billion corresponds to one minute in 2,000 years, or a single penny in \$10,000,000.

				TEST RES	ULTS			
Contaminant	Violation Y/N	Date Collected	Level Detected	Range of Detects or # of Samples Exceeding MCL/ACL	Unit Measure- ment	MCLG	MCL	Likely Source of Contamination

82. TTHM [Total trihalomethanes]	N	2020	55	42.1 – 59.5	ppb	0		80	By-product of drinking water chlorination.
Chlorine	N	2020	1.4	.7 – 2	ppm	0	MRI	DL = 4	Water additive used to control microbes

^{*} Most recent sample. No sample required for 2020.

We have learned through our monitoring and testing that some contaminants have been detected however the EPA has determined that your water IS SAFE at these levels.

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Our water system is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead. The Mississippi State Department of Health Public Health Laboratory offers lead testing. Please contact 601.576.7582 if you wish to have your water tested.

To comply with the "Regulation Governing Fluoridation of Community Water Supplies", the NE MS Regional Water is required to report certain results pertaining to fluoridation of our water system. The number of months in the previous calendar year in which average fluoride sample results were within the optimal range of 0.6-1.2 ppm was 11. The percentage of fluoride samples collected in the previous calendar year that was within the optimal range of 0.6-1.2 ppm was 92%.

All sources of drinking water are subject to potential contamination by substances that are naturally occurring or man made. These substances can be microbes, inorganic or organic chemicals and radioactive substances. All drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline at 1.800.426.4791.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbiological contaminants are available from the Safe Drinking Water Hotline 1.800.426.4791.

This Water System purchases its drinking water from N.E.M.S Regional Water District. We strive to provide adequate, clean and safe drinking water to our customers. We ask for you to report any leaks you may find to Town Hall. Thank You!.

The Town of Mantachie works around the clock to provide top quality water to every tap. We ask that all our customers help us protect our water sources, which are the heart of our community, our way of life and our children's future.

2020 Annual Drinking Water Quality Report Town of Atantachie P1981: 0290005 May 2021

We're pleased to present to you this year's Annual Quality Water Report. This report is designed to inform you about the quality water and services we deliver to you every day. Our constant goal is to provide you with a safe and dependable apply of orthing water. We want you to understand the efforts we make to continuely improve the water restment process and potent our water resources. We are nomented to ensuring the quality of your water.

If you have any quasifons about this report proncerning your water utility, please dontact Rodney Meterna at S62 252.7948. We want our valued customers to be informed about from water utility. If you want to learn more, see also also also any of our requisity schooled meetings. They are held on the second Tuesday of each more at 300 PM at the Mantachia from Ital.

In order to better serve our distormers with a better water supply the Town of Mantachie began purchasing our water from the Northeast MS Regional Water Supply, which has greatly improved our water system. The source water assessment has been completed for our public water system to determine the overall susceptibility of its distribing water study poperatal pairwas of contaminations. Are port to outsigning of studied information on how the susceptibility of its distribung water state over made; has been furnished to our public water system and is available for waving upon request, The west for the Town of Mantachie laws included Saver to moderate assessment from the contamination.

We routinely monitor for contaminants in your criming wifer according to Federal and State laws. This table below lists all of the criming witer contaminants and were detected during the period of January (1º to December 3.1º 1923). In cases where monitoring wasn't required in 2020, the fable reflects the most recent residue, Air water fravels over the surface of faind or uncerpound, it to assert wasn't required in 2020, the fable reflects the most recent residue, Air water fravels over the surface of faind or uncerpound, it dissolves wasn't required to contaminate from a sense cases, reddendative make rails and on pick up substances or contaminants from the presence of animals or from human activity, refered is contaminants, such as when and building, rest may come from sewage treatment plants, as placed to the surface of the surface

in this table you will find many some and addreviations you might not be familiar with. To help you better uncerstand these terms we've provided the following definitions:

According to the concentration of a contaminant which, if exceeded, triggers transment or other requirements which a water system must follow:

Maximum Consomment Level (MCL) - The "Maximum Allowed" (MCL) is the nightest level of a commission that is released in extraction regiment technology.

Williams set as done to the MCLGs as females using the pest available treatment technology.

Harmon Contaminent Level Good MCLG: - The "Goof MCLO) is the level of a contaminant in criming water below which there is no cream or expected risk to meets. MCLGs allow for a march of safety.

Maximum Residual Distributant Level (MRDL) — The highest level of a distributant atomical in amining water. There is convincing evidence that addition of a distributant's necessary to control mergorial contaminants.

Parts per million (pain) or Milligrams per liter (mg/l) - one part par million corresponds to one minute in two years or a stripto panny in \$10,000.

Paras per billion (ppb) or Micrograms per last - and part per billion comesponds to one minute (in 2,600 years, or a single penny \$10,000,000.
